

TANK DIVIDERS - SUCTION CUPS

Remove Protective Film
(usually paper)
After Test Fitting

Thank you for choosing our Tank Dividers.

First, please inspect your new tank divider prior to proceeding. If anything is missing or damaged in shipping please contact us ASAP for a replacement. Our contact info is below, or you can contact us through our Ebay store at <https://www.ebay.com/str/marinebiosystems>.

If everything looks good then please test fit the divider in your tank before removing the protective film.

To install, slide the suction cup holders into the divider support slots with the suction cups facing out as show above. Then drop the divider into the tank and rotate it into position. You may need to adjust or push the suction cups in while installing to get it to fit. Don't force it, if it's taking too much effort than there may be a fitment issue with your tank..

Due to variations in tank manufacturing there will be a gap between the glass and the divider when it is installed perpendicular to the walls and bottom. This is perfectly normal. That gap should not exceed 1/8" along any edge. If you feel the gap is too wide for your application please contact us and we'll work with you to correct the issue.

If everything fits properly, then remove the divider, remove the protective film and reinstall.

If you need any other acrylic products for your aquarium we welcome you to shop at <https://www.ebay.com/str/marinebiosystems> or contact us directly. We offer a wide variety of products and build custom items to order.
